

Zaychi vruch (Kabyle), Yambol district. Artificially hewn out of the rock trenches, oriented East–West and North–South, used for observations of the Sun in *its extreme positions on the visible horizon* (solstices and equinoxes) and *culminations* of bright luminaries. An additionally leveled rock, located in the northeast, allows determination of the summer solstice. This device could be used for measuring time intervals longer or shorter than a day.
